AI Engineer | LLM agents & MCP inside banking & telecom systems that can't go down | 12 yrs Java/Spring Boot · Spring AI, RAG, AWS & GCP · Production, not demos

Área metropolitana de Bogotá D.C.

Extracto

Most AI features don't fail because of the model. They fail because the backend was never designed for non-deterministic systems. I've spent 12 years building Java and Spring platforms for banking, telecom, healthcare and retail — systems where an outage is an incident report, not a bad day. For the last two years I've been putting LLM agents inside that same class of system and keeping them running. That is the work I do: AI inside platforms that already have auth, audit trails, PII rules, SLAs and someone on call. What that looks like: — Digital banking on Backbase DBS: arrangements, transactions, limits and maker-checker approval matrices. Spring Cloud Gateway, OAuth2/OIDC, saga patterns for money flows that cannot end half-done. — A five-service telecom platform on GCP implementing TMF standards. Cloud Run, Spanner with SCD-2 history tables and a transactional outbox, Pub/Sub with dead-letter queues, customer PII tokenized through Cloud DLP with versioned HMAC keys, secrets moved out of environment variables into Secret Manager. — An agent platform I built and still operate: WhatsApp and voice agents on AWS Lambda, DynamoDB, EventBridge and SQS FIFO. Real constraints, not a sandbox — per-portfolio messaging limits, template category audits, error codes you must never retry, a one-second turn budget on voice, and a cost per conversation that has to stay below what the customer pays. How I work: I treat an agent like any other distributed system. Every prompt or model change ships as an experiment: a regression bank of replayed real conversations, canary promotion, and a config fingerprint on every logged run — because "the prompt got better" is not a claim you can defend without one. I use AI to write code and I review every line of it at the boundaries that matter: schemas, money, auth, and anything that deletes. Those it does not touch unreviewed. I work in English with distributed teams across the US and Latin America, from Bogotá. If you are adding AI to a platform

that already has customers, compliance and an on-call rotation, that is the problem I solve.

Experiencia

Vitzi tech

Lead AI Engineer — Yatendi (production agent platform)

junio de 2024 - Present (2 años 4 meses)

California, Estados Unidos

- Built and operate a multi-tenant agent platform on AWS serverless (Lambda, DynamoDB, EventBridge Scheduler, SQS FIFO, Secrets Manager) that handles WhatsApp, Instagram and voice conversations for live businesses.

- Voice agents were unusable above ~2s of turn latency. Built a custom LLM-streaming bridge over the telephony provider and cut the turn budget to a ~1s target.

- Meta's messaging rules break naive senders: limits computed at business portfolio level, template category audits, and error codes that must never be retried. Built the send worker around rate-limited SQS FIFO with those rules encoded, instead of retry loops.

- Agent quality was anecdotal. Built a closed loop: every run logged with a configuration fingerprint, deterministic checks separated from judgment calls, changes shipped as experiments against a regression bank of replayed real conversations, promoted by canary.

- Unit economics are a hard engineering constraint: cost per conversation has to stay under the subscription price.

Enghouse Networks

AI Software Engineer — Telecom Platforms (TMF) & Cloud Architecture

marzo de 2023 - Present (3 años 7 meses)

Santiago Metropolitan Region, Chile

- A american operator needed exposed as TMF-compliant APIs, with no existing platform to build on. I led the design and delivery of fourteen Java/Spring Boot microservices on GCP Cloud Run implementing TMF Standards

- Chose Cloud Spanner over a conventional relational store because the address model needed GEOGRAPHY columns, SCD-2 history and horizontal

reach across regions. Designed the schema forward-compatible with the next phase so the wireline expansion landed without a migration.

- Customer PII was flowing through logs and environment variables. I moved it behind Cloud DLP tokenization with versioned HMAC keys, KMS-managed encryption and per-service least-privilege IAM, and pulled every secret into Secret Manager.

- Made event delivery survivable: Pub/Sub with dead-letter queues and a transactional outbox, so a downstream failure stops being a lost event.

- Set the delivery model: trunk-based development with GitLab MR gates and dependency + container scanning in CI.

24/7 Software

Technical Lead | Java Spring Boot | React | Angular | AWS | MySQL | Kubernetes | PostgreSQL

noviembre de 2021 - diciembre de 2022 (1 año 2 meses)

Boca Raton, Florida, United States

As the Technical Lead of 247Software I've supervised aspects of the development of multiple software projects

From estimating time and resources, to developing and improving existing apps to ensure that all issues and defects are appropriately identified and resolved in a timely manner during the whole development process.

Besides removing impediments for the teams, among of my main day to day responsibilities are:

Coordinate the development and integration of the releases of the Frontend and Backend teams

Worked along the BA teams and our clients to improve the usability and user experience of the released applications and guide the road map of future releases

Prioritization of goals, time managing and resources to enable the team to release on schedule and without issues

Follow up on open issues and high priority features.

Among others

Emida Technologies

Senior Software Engineer — High-Traffic Payments & Retail Platforms

enero de 2017 - mayo de 2022 (5 años 5 meses)

Foothill Ranch California

- * Design and development of web applications & apps (android) with high traffic and reach.
- * Professional software engineering practices for the full software development life cycle, including coding standards, code reviews, source control management, build processes.

Indra

Java Software Engineer

junio de 2016 - enero de 2017 (8 meses)

Bogotá, Capital District, Colombia

- * Design and develop large scale web applications.
- * Develop relevant services and more complex interfaces / databases that communicate with the operating system, communications protocols, database structures, user interfaces, and web elements.
- * Evaluate the functional and detail design.
- * Use the appropriate test methodologies to test the system / database and implement them according to a particular approach.
- * Develop the structure of the application and define the program specifications.
- * Develop test application software and prototype information systems.
- * Prepare the documentation of the program and contribute to the preparation of user documentation.
- * Respond to customer queries, study and resolve them or transfer them to the right person.
- * Perform tasks that the project demands as established by the leader or project manager.
- * Develop progress reports on all assigned tasks. Inform the analysts / project manager about the problems of the application, in order to take the corrective measures that ensure the execution of the execution deadlines and the good operation of the application.

Technologies:

- Oracle Database
- WebLogic 12c
- SOAP
- Spring MVC, Primefaces
- JSP, XHTML.
- Subversion

Fundación Petrociencia

Java Software Engineer

octubre de 2013 - enero de 2016 (2 años 4 meses)

Maracaibo, Zulia State, Venezuela

*Integrated system for handling and analysis of wells.

* System for the automated management of workflows in integrated studies of reservoirs

* System for the realization of mechanical diagrams of wells.

* System for the elaboration of norms and Procedures for the protection of the data of an integrated study.

Technologies:

- Oracle Database, PostgreSQL
- WebLogic 12c, Red Hat Containers, Tomcat
- REST, SOAP & RPC
- Spring REST, Spring MVC, Primefaces
- jBPM (toolkit for building business applications to help automate business processes and decisions)
-
- Apache Solr (Solr is the popular, blazing-fast, open source enterprise search platform)
- Angular
- HTML5, JSP, XHTML.
- Git

Educación

Universidad Rafael Belloso Chacín

BS degree in Computer Science · (2008 - 2011)

University of Zulia

Master of Computer Applications Msc · (enero de 2018 - febrero de 2020)
